

How to run the Project

First run npm install on the projects root folder

Download and install mongo dB server from the official website

Check the projects mongo dB localhost port where it matches the projects port in index.js file

Open the development server by running npm index

Register a user and change the users isAdmin property in the user's collection to true in the mongodb server

Login again to the application with the user whose isAdmin status is true

The user will be redirected to admin section where they can create a new room category

View reservations details

View system users

View available room categories

A normal user can view the created room categories and filter them according to their preference.

From there a user can view the selected room type and make a reservation

A user can edit their details used during registration
